

Nimbus Analytics - Engineering Onboarding Guide

Welcome to Nimbus Analytics! This guide will walk you through your first two weeks as a new engineering hire.

Day 1: Setup

On your first day, IT will provide you with a company laptop pre-configured with the standard engineering toolchain, including VS Code, Docker, and the Nimbus internal CLI. You will receive credentials for GitHub, Slack, and the AWS sandbox account. Multi-factor authentication must be configured on all accounts before you can access any production systems, per company security policy.

Week 1: Onboarding Buddy and Codebase Orientation

Every new engineer is paired with an onboarding buddy, an experienced team member who is available for questions during your first 30 days. During week one, you'll complete the 'StreamSight Architecture' training module and set up the local development environment following the README in the main monorepo. You are expected to submit your first pull request, typically a small documentation fix or test addition, by the end of week one.

Week 2: First Feature Ticket

In week two, your manager will assign your first real feature ticket, scoped to be completable within 3-5 days. Code review turnaround time at Nimbus Analytics is expected to be within 24 hours on business days. All code must pass the CI pipeline, which includes unit tests, linting, and a security scan, before it can be merged to the main branch.

Engineering Culture

Nimbus Analytics follows a blameless post-mortem culture for production incidents. Engineers are encouraged to write RFCs (Request for Comments) for any architectural change affecting more than one service. RFCs are reviewed in the weekly Architecture Review meeting held every Wednesday at 2:00 PM.

30-60-90 Day Check-ins

Your manager will schedule formal check-in meetings at the 30, 60, and 90 day marks to discuss your progress, gather feedback on the onboarding process, and set goals for the next period. Your first formal performance review will take place in the standard June or December review cycle, whichever comes first after your 90-day mark.
